

Tattoo Removal Aftercare Instructions

The tattoo removal laser treatment may create a superficial burn wound. Some clients may experience bruising or swelling. There is immediate whitening of the treated area, which usually lasts for several minutes. Many clients then develop blisters, crusts, or scabs within 12-72 hours, which may last for 1-2 weeks or more. The treated areas may be pink or pale after the scab separates. Loss of skin pigment in the treated area is common, and is usually temporary. Healing is usually complete by 6-8 weeks.

1. Keep the treated area clean and dry while it is healing. Clean the area gently with soap and water and then gently pat the area dry. You may apply a thin coating of antibiotic ointment up to three times a day while the area is healing if you keep the area covered with a sterile dressing.
2. You may apply cool compresses as necessary for 24 hours after the laser treatment to help reduce discomfort and inflammation. You may take plain Panadol, but avoid aspirin (it can increase the risk of bruising and/or bleeding.)
3. Do not pick at the scab or allow the skin to become scraped, as this may result in infection and scarring. Shaving should be avoided in the treated area until it is completely healed.
4. Do not wear makeup or any cream or medication unless recommended by our office for 48 hours.
5. Wear a sunblock with an SPF 30+ or higher over the area for 2 months following the treatment. If possible, avoid direct UV exposure to the treated area for at least 4 weeks.
6. If the area looks infected (honey colored crusting and oozing or spreading redness), if you experience an unusual discomfort or bleeding, if any other complications develop, or if you have any questions or concerns, contact the office immediately.
